Specifications & Dimensions

Supply water pressure limits	40-100 psi (280-689 kPa)
Supply water temperature limits	40-100 °F (4-38 °C)
Maximum total dissolved solids (TDS)	2000 ppm
Maximum water hardness @ 6.9 pH	10 gpg
Maximum iron, manganese, hydrogen sulfide	0
Chlorine in water supply (max. ppm)	2.0
Supply water pH limits (pH)	4-10
Product (quality) water, 24 hours ¹	14.76 gal. (55.9 liters)
Percent rejection of TDS, minimum (new membrane) ¹	86.5
Automatic shutoff control	yes
Efficiency ²	10.6 %
Recovery ³	21.2 %

This system conforms to NSF/ANSI 58 for the specific performance claims as verified and substantiated by test data.

¹@ Feed water supply at 50 psi, 77°F, and 750 TDS --- Quality water production, amount of waste water and percent rejection all vary with changes in pressure, temperature and total dissolved solids.

²Efficiency rating means the percentage of the influent water to the system that is available to the user as reverse osmosis treated water under operating conditions that approximate typical daily usage.

³Recovery rating means the percentage of the influent water to the membrane portion of the system that is available to the user as reverse osmosis treated water when the system is operated without a storage tank or when the storage tank is bypassed.

Non-potable Water Sources: Do not attempt to use this product to make safe drinking water from non-potable water sources. Do not use the system on microbiologically unsafe water, or water of unknown quality without an adequate disinfection before or after the system. This system is certified for cyst reduction and may be used on disinfected water that may contain filterable cysts.

Arsenic Reduction: This system shall only be used for arsenic reduction on chlorinated water supplies containing detectable residual free chlorine at the system inlet. Water systems using an inline chlorinator should provide a one minute chlorine contact time before the reverse osmosis system.

Nitrate/Nitrite Test Kit: This system is supplied with a nitrate/nitrite test kit. Product water should be monitored periodically according to the instructions provided with the test kit.

Installations in the Commonwealth of Massachusetts: The Commonwealth of Massachusetts requires installation be performed by a licensed plumber and do not permit the use of saddle valves. Plumbing code 248-CMR of the Commonwealth of Massachusetts must be followed in these cases.

Product Water Testing: The Reverse Osmosis system contains a replaceable treatment component critical for the effective reduction of total dissolved solids. Product water should be tested periodically to verify that the system is performing properly.

Replacement of the reverse osmosis component: This reverse osmosis system contains a replaceable component critical to the efficiency of the system. Replacement of the reverse osmosis component should be with one of identical specifications, as defined by the manufacturer, to assure the same efficiency and contaminant performance.

Questions? Call Toll Free 1-866-986-3223 or visit whirlpoolwatersolutions.com

When you call, please be prepared to provide the model, date code and serial number, found on the rating decal, located inside the cover.

Inspect Shipment

Your Reverse Osmosis Drinking Water System is shipped complete in one carton. Remove all items from your shipping carton.

Check all items against the packing list below. Note any items lost or damaged in shipment.

Note any damage to the shipping carton. Refer to the exploded view and parts list in the back of the manual for the part names and numbers of missing or damaged items. If problems exist, refer to the website or the toll free number listed throughout this manual.

Keep the small parts in the parts bag until you are ready to install them.

Packing List

FIG. 2

Plan Your Installation

All install parts included in package.

Typical Under Sink Installation

FIG. 3

Typical Remote Installation
Additional parts required.

FIG. 4

Plan Your Installation

Read through the entire manual before beginning your installation. Follow all steps exactly. Reading this manual will also help you get all the benefits from your system.

Your Reverse Osmosis Drinking Water System can be installed under a sink or in a remote location. Typical remote sites are a laundry room or utility room. Review the location options below and determine where you are going to install your system.

NOTE: For best system performance, the feed water to the system should be softened or have hardness less than 10 grains per gallon, with no iron, manganese or hydrogen sulfide.

UNDER THE SINK LOCATION

The Reverse Osmosis Filter Assembly and storage tank may be installed in a kitchen or bathroom sink cabinet. See Fig. 3.

A suitable drain point is needed for drain water from the Reverse Osmosis system.

REMOTE INTERIOR LOCATION

The Reverse Osmosis Filter Assembly and storage tank may also be installed in a remote interior location away from the Reverse Osmosis Faucet. You will need a nearby water source and drain point. See Fig. 4.

CHECK SPACE REQUIREMENTS

Check size and position of items for proper installation into location chosen.

TOOLS NEEDED

Review the tools needed list. See Fig. 5. Gather needed tools before proceeding with the installation. Read and follow the instructions provided with any tools listed here.

TOOLS NEEDED

Thread Sealing Tape

Tape Measure

Adjustable Wrench

Philips Screwdriver

Flathead Screwdriver

Drill & Drill Bits, if required

Adjustable Large Jaw Pliers

OR Pipe Wrench

FIG. 5

Overview and Site Preparation

OVERVIEW

Read through the entire manual before beginning your installation.

There are seven steps to installing your Drinking Water system. They are as follows:

STEP A - Install Cold Water Supply Fitting

STEP B - Install Drain Adapter

STEP C - Install Reverse Osmosis Assembly

STEP D - Install Storage Tank

STEP E - Install Reverse Osmosis Faucet

STEP F - Connect Tubing

STEP G - Sanitize, Pressure Test & Purge System

These steps are explained in detail over the next few pages. Follow all steps. Reading this manual will also help you receive and use all the benefits your Reverse Osmosis system can give you.

PREPARE SITE FOR INSTALLATION

1. Before starting, close the hot and cold water shutoff valves (See Figure 6).
2. Temporarily place tank and filter assembly into planned location. Check position of items and space required for proper installation. Ensure tubes may be routed without kinking.
3. Remove tank and filter from planned location and set aside.

NOTE: You must check and comply with all local plumbing codes.

Step A - Install Supply Water Fitting

CHOOSE TYPE OF WATER FITTING TO INSTALL

Check and comply with local plumbing codes as you plan, then install a cold water supply fitting. Refer to the Specifications page for supply water requirements. The fitting must provide a leak-tight connection to the RO 1/4" tubing. A typical connection using the included water supply fitting is shown in Figure 6. An optional connection using standard plumbing fittings (not included) is shown in Figure 6B.

NOTE: Local code may dictate which type of water fitting is used. Consult a plumber if you are not familiar with local codes or plumbing procedures.

INSTALL COLD WATER SUPPLY FITTING

(Included)

This fitting will be installed on the cold water pipe. The fitting must provide a leak-tight connection to the Reverse Osmosis 1/4" tubing. Locate the cold water line in the sink cabinet. It is recommended, but not required, that the cold water line be soft water.

Complete the following steps to install the water supply fitting.

1. Close the hot and cold water shutoff valves under the sink where the cold water supply fitting will be installed, and open faucet(s) to relieve pressure.
2. Disconnect the existing cold water line from the water shutoff valve.
3. Make sure that the water supply fitting's gasket is inside the female threaded portion of the fitting.
4. Install the water supply fitting onto the cold water shutoff valve, where the existing cold water line was removed, and hand tighten. Be careful not to cross thread or over-tighten.
5. Connect the existing cold water line to the male threaded portion of the water supply fitting and hand tighten. Be careful not to cross thread or overtighten.

OPTIONAL PIPE FITTINGS

(compression type shown)

NOTE: Be sure to turn off the water supply and open a faucet to drain the pipe.

Complying with plumbing codes, install a fitting on the cold water pipe to adapt 1/4" OD tubing. A typical connection is shown in Figure 6B. If threaded fittings are used, be sure to use pipe joint compound or thread sealing tape on outside threads.

**Cold Water Supply Connection
(using included water supply fitting)**

FIG. 6

**Cold Water Supply Connection
(using compression fitting - not included)**

FIG. 6B

Step B - Install RO Drain Under Sink

INTRODUCTION

A suitable drain point is needed for the drain water from the Reverse Osmosis filter. You have two options:

- **Install the Drain Adaptor included with your unit**
As shown in Figures 7-9, the drain adaptor is installed onto your sink's drain pipe above the P-trap. This is normally used for under sink installations.
- **Use another existing drain in your home**
As shown in Figures 10 and 11, the drain tube from the RO filter runs directly to an open drain. This is often used for remote location installations.

NOTE: An incorrectly connected drain point can cause water to leak from the faucet's air gap.

NOTE: Local code may restrict the type of drain installation to use. Either drain installation type, if permitted by code, may be used in under sink or remote location installations. Consult a plumber if you are not familiar with plumbing procedures.

INSTALL DRAIN ADAPTOR

(Under sink Installation)

The drain adaptor included with your RO system is designed to fit around a standard 1-1/2" O.D. drain pipe. In the following procedure, you will install the drain adaptor above (upstream of) the P-trap. See Fig. 7 & 9. Be sure to comply with local plumbing codes.

NOTE: Before starting this procedure, inspect the drain pipe under the sink for corrosion, and replace if necessary, before continuing with installation.

1. Test fit the two halves of the drain adaptor onto the sink drain pipe, about 6 inches above the P-trap (See Fig. 8). Make sure that the Q.C. fitting is toward the direction of the RO faucet (See Fig. 9).
NOTE: Locate so that the drain tubing from the Reverse Osmosis faucet will run straight to the adaptor, with no dips, loops, or kinks.
2. Using the hole through the drain fitting as a guide, mark the pipe where a 3/8" hole will be drilled (See Fig. 8), and remove the drain adaptor from the pipe.
NOTE: Do not drill through the drain adaptor's Q.C. fitting, as this could damage the o-ring.
3. Drill a 3/8" dia. hole in the pipe and remove flash.
4. Clean the sink tailpiece to assure a leak-tight fit.
5. Place the halves of the drain fitting back onto the sink drain pipe. Use a pencil or similar pointed object to align the Q.C. fitting so that it is centered on the hole you drilled.
6. Assemble the nuts and screws, as shown in Figure 9, and tighten both sides equally to secure the drain adaptor halves onto the pipe. Do not overtighten.
7. Do not connect black tubing to the Q.C. fitting at this time. It is done after the RO faucet is installed.

Under the Sink Installation

FIG. 7

FIG. 8

IMPORTANT: Do not install drain adaptor below the P-Trap. Locate drain adaptor so that when the black drain tube from the Reverse Osmosis Faucet is installed it will run straight to the adaptor, with no dips, loops, or kinks.

FIG. 9

Step B - Install RO Drain in Remote Location

FIG. 10

FIG. 11

INSTALL A REMOTE DRAIN POINT AND AIR GAP (Remote Location)

Route the drain tubing to an existing drain in the house. A floor drain, laundry tub, standpipe, sump, etc. are suitable drain points. See Fig. 11. This type of drain is the preferred over the p-trap drain adapter. Always be sure to provide a 1-1/2" air gap between the end of the hose and the drain point. This will prevent water from backing up into the system.

NOTE: Check your local plumbing codes.

To install a remote drain point, complete the following steps:

1. Locate the 1/4" red tubing on the Reverse Osmosis filter assembly. See Fig. 10.
2. Determine if this length is long enough to reach the drain point. Longer lengths of tubing (see parts list in back of manual) may be needed.
3. If longer tubing is required, disconnect the 1/4" red tubing and replace with an adequate length of tubing to reach the drain point. Refer to Step F later in the manual on how to disconnect and connect tubing.
NOTE: A flow control insert is located inside the fitting that the drain tube connects to. See No. 12 on page 22. Leave this fitting in place.
4. Route the tubing to the drain point and secure at the end with a bracket (not included). See Fig. 11. Provide a 1-1/2" air gap between the end of the tube and the drain. See Fig. 11.

Step C - Install RO Filter Assembly

INSTALL REVERSE OSMOSIS FILTER ASSEMBLY

The Reverse Osmosis Filter Assembly can sit upright or lay on its side. See Fig. 12.

FIG. 12

Step D - Install Storage Tank

The fitting on the supply tank may need to be tightened 7-8 full turns to get a good seal.

Do not overtighten.

INSTALL STORAGE TANK

1. Apply thread sealing tape (2 wraps clockwise) to the threads on the nipple at the top of the tank. See Fig 13.
2. Locate the tubing connector (shutoff valve). See Fig. 13. Tighten the tubing connector onto the tank nipple 7-8 full turns, being careful not to cross thread or overtighten.
3. Do not connect the tube at this time. This will occur later in the assembly.
4. Place the storage tank next to the Reverse Osmosis Assembly. The tank can be placed upright or on its side.

FIG. 13

Step E - Install RO Faucet

SELECT LOCATION OF REVERSE OSMOSIS FAUCET MOUNTING HOLE

You will need to select the location of the Reverse Osmosis Faucet. You have three options to choose from:

- **Use the existing sink top hole for the spray hose or soap dispenser** (Must be 1-1/4" in diameter)
- **Drill a new hole in the sink**
- **Drill a new hole in the countertop next to the sink**

1. Determine where you are going to install your Reverse Osmosis Faucet.
2. Check to ensure the Reverse Osmosis faucet will mount flat against the mounting surface.

3. Visually review the routing of the tubes from the Reverse Osmosis filter assembly to the faucet. Check to ensure there is adequate tube routing space between the faucet and filter assembly.

4. If drilling is needed, drill a 1-1/4" diameter hole in the mounting surface.

IMPORTANT: Drilling holes into countertops and sinks should only be performed by an installer who is qualified for drilling such materials. Drilling of surfaces made of stone or solid surface materials such as granite, marble or plastic resin products, or sinks made of porcelain or stainless steel may cause permanent, irreparable damage to the sink or countertop surface.

Step E: Install RO Faucet (cont.)

INSTALL REVERSE OSMOSIS FAUCET

1. Locate and organize your RO faucet install parts. Refer to Fig. 14.
2. Snap the o-ring into the groove on the bottom of the base and slide the base onto the faucet stud. See Fig. 14.
3. Locate the 3/8" black tubing and push one end onto the 3/8" faucet barb fitting, see Fig. 15.
4. Move the RO system into position, under the sink. See page 10.

NOTE: If you routed the red drain tubing directly to a remote drain point (see page 9), disregard step 5 and move on to step 6.

5. Locate the 1/4" red tube assembled to the RO assembly. Remove shipping cap from the loose end of the red tube. Route the red tubing from the bottom, up through the faucet mounting hole. Cut tube to length as needed, cutting the end square. See Fig. 16. Push the end of the tubing onto the 1/4" barb fitting. See Fig. 15.
6. Work tubing and the faucet stud down, into the mounting hole.
7. On the underside of the sink or countertop, install the spacer, flat washer, and hex nut. Slide the large steel washer into place between the countertop and spacer. Then, tighten the hex nut securely.
8. Thread the quick connect fitting onto the bottom of the faucet stud.
9. Locate the 3/8" blue tubing assembled to the RO assembly. Remove shipping cap from the loose end and route the blue tubing to the quick connect fitting on the bottom of the faucet stud. Cut tube to length as needed, cutting the end square. See Fig. 16. Push the end of the blue tubing into the quick connect fitting. See Fig. 15.

FIG. 14

FIG. 15

Step F - Connect Tubes

HOW TO CUT AND CONNECT THE TUBES

Your Reverse Osmosis system includes push-in fittings for quick tubing connection. Review the following instructions before connecting the tubes in the next step. Failure to follow these instructions may lead to future leaks.

Cut tubes to length

1. Use a sharp cutter or knife to cut the end of tubing. Always cut the tubing square. See Fig. 16.
2. Inspect the tube up to 1" from the end to be sure there are no nicks, scratches or other rough spots. If needed, cut the tubing again. See Fig. 16.

Connect tubes

1. Push tubing through collet, until it engages the o-ring. See Fig. 17. Continue pushing until the tube bottoms out against the back of the fitting. See Fig. 18. Do not stop pushing when the tube engages the o-ring. Failure to follow these instructions may lead to future leaks. When a 1/4" tube is fully engaged, 11/16" of the tube has entered the fitting. When a 3/8" tube is fully engaged, 3/4" of the tube has entered the fitting. Mark tube with a piece of tape or marker. See Figs. 17 & 18.
2. If additional tubing is required, see parts list at the end of this manual.

To Disconnect Tubes

1. Push the collet inward with a finger tip. See Fig. 20.
2. Continue holding collet inward while pulling the tubing out. See Fig. 20.

Cut tubing square with end of tubing round, smooth, with no cuts, nicks or flat spots.

Tube Correctly Cut

FIG. 16

Tube Partially Engaged with Fitting

FIG. 17

Tube Fully Engaged with Fitting

FIG. 18

Collet and O-Ring

FIG. 19

Disconnect Tubing

FIG. 20

Step F - Connect Tubes (cont.)

Tube Connections

FIG. 21

ROUTE YELLOW TUBE TO STORAGE TANK

1. Locate the yellow tube attached to the Reverse Osmosis filter assembly.
2. Remove shipping cap from the loose end of the yellow tube. Route yellow tube to the fitting on top of the storage tank. See Fig. 21.
3. Cut tube square and to length. See Fig. 16.
4. Do not connect at this time. This will occur in the sanitizing step.

CONNECT GREEN TUBE TO COLD WATER SUPPLY PIPE

1. Locate the 1/4" green tube attached to the Reverse Osmosis filter assembly.
2. Remove shipping cap from the loose end of the green tube. Route green tube to the fitting on the water supply pipe. See Fig. 21.
3. Cut tube square and to length. See Fig. 16.
4. Connect to cold water supply fitting. See Fig. 6.
5. Insert all the way into the fitting. See Figs. 17 & 18.
6. Pull on the tube to be sure it is held firmly in the fitting.

CONNECT BLACK TUBE FROM REVERSE OSMOSIS FAUCET TO DRAIN ADAPTER

1. Locate the 3/8" black tube attached to the faucet. Fig 21.
2. The loose end needs to be attached to the black collet on the sink drain adapter.
3. Route it as straight as possible, without loops, dips, or kinks.
4. Cut the end of the tube square. See Fig. 16.
5. Insert all the way into the fitting. See Figs. 17 & 18.
6. Pull on the tube to be sure it is held firmly in the fitting.

RED TUBE TO REVERSE OSMOSIS FAUCET

The red tube connection was completed in the faucet assembly steps.

BLUE TUBE TO REVERSE OSMOSIS FAUCET

The blue tube connection was completed in the faucet assembly steps.

Step G - Sanitize, Test and Purge System

SANITIZE THE SYSTEM

Sanitizing is recommended immediately after installation of the Reverse Osmosis system. It's also recommended after servicing inner parts. It is important that the person installing or servicing the system have clean hands while handling inner parts of the system. Complete the following steps to sanitize the system. See Fig. 22.

1. Make sure that the water supply to the Reverse Osmosis system is off.
2. Open the Reverse Osmosis faucet. If the tank is not already empty, allow the water to empty.
3. Locate the eyedropper included in the parts bag and common household bleach.
4. Add 3 ml. of bleach into open end of yellow tubing. Handle bleach according to bleach manufacturer's recommendations. See Fig. 22.
5. Connect yellow tubing to tank connector. See Figs. 13 and 22.
6. Sanitizing the system will be completed during the pressure test and purging steps on the following page.

NOTE: The bleach must be removed from the system before drinking the water. See purging instructions on the next page.

FIG. 22

Manufacturer recommends using the Model 7301203 Sanitizing Kit

This reusable sanitizing kit (not included) is recommended to easily and completely sanitize your Reverse Osmosis system annually.

The kit includes the following:

- Prefilter sanitization cartridge (contains no filtration media)
- Postfilter sanitization cartridge (contains no filtration media)
- RO sanitization cartridge (contains no RO membrane)
- Syringe, 1 oz.
- Complete instructions

Uses standard household bleach (not included) to completely sanitize the Reverse Osmosis system.

To order, go to

www.whirlpoolwatersolutions.com

and click on the "Replacement Parts" link under the "Owner Center" tab,

or call toll free **1-866-986-3223**

Step G - Sanitize, Test and Purge System (cont.)

PRESSURE TEST THE SYSTEM

NOTE: Complete the sanitizing procedures on the preceding page before pressure testing.

To pressure test the system, complete the following steps.

1. Open the water supply valve(s) that you closed before installing the Reverse Osmosis system.
2. Purge air from the plumbing by opening the sink faucet(s). Close faucet(s) when water runs smooth, with no spurting.
3. Pressure will start to build in the RO system. In about 2 hours check all fittings and connections. Check for water leaks. Fix leaks if any are found. If problems exist, refer to the troubleshooting chart or call the toll free number below).

NOTE: When the system is first pressurized, water may "spurt" from the faucet air gap hole until air is expelled from the RO system.

Please review the following operating features before using your Reverse Osmosis system:

You will **not** have filtered water immediately. It may take several hours to fill the storage tank and create maximum flow from the Reverse Osmosis faucet.

Water Pressure from the Reverse Osmosis faucet will be less than your standard faucet.

Water will run to the drain while the Reverse Osmosis system is producing water, even if you are not drawing water from the Reverse Osmosis faucet. You may hear a small quantity of water going to the drain at times when water is not being used. This is normal. Water going to the drain will automatically shut off when the storage tank is full.

FIG. 23

PURGING THE SYSTEM

To purge the system, complete the following steps.

1. Open the Reverse Osmosis Faucet and let water flow through the system for a 24 hour period. Water flow will be a slow trickle at this time.

NOTE: Do not consume water from the RO system until purging is complete.

2. Close the Reverse Osmosis faucet after the 24 hour purging period is complete.
3. When the purging is finished, your Reverse Osmosis system is ready for use.

NOTE: As with all other water system applications, leaks may occur. Because the system pressure builds slowly, leaks may not be immediately apparent. Recheck for leaks 24 hours after purging the system is complete.

How Your RO Water System Works

HOW YOUR REVERSE OSMOSIS SYSTEM WORKS

Introduction: Your Reverse Osmosis (RO) Drinking Water System uses your household water pressure to force water through three filters. Impurities are filtered out. Delicious tasting drinking water goes to the storage tank-ready for your use. Impurities are sent down the drain. The following paragraphs will explain in detail how your Reverse Osmosis Drinking Water System works.

Prefilter: Water from the cold supply pipe enters the prefilter. See Fig. 24. The prefilter is a replaceable sediment cartridge with activated carbon in its composition. The cartridge reduces taste, odor, sand, silt, dirt, other sediments, and up to the amount of chlorine shown in the specifications.

Reverse Osmosis Cartridge: Filtered water flows from the prefilter to the Reverse Osmosis membrane cartridge. See Fig. 24. The Reverse Osmosis cartridge is a tightly wound special membrane. The membrane reduces the dissolved solids and organic matter. High quality product water (about one ounce per minute) exits the Reverse Osmosis cartridge. The product water flows to the storage tank, postfilter or Reverse Osmosis faucet. Drain water, with the dissolved solids and organic matter, is routed to the drain.

Storage Tank: The storage tank holds product water. See Fig. 24. A diaphragm inside the tank holds water pressurized to about half of supply water pressure when the tank is full. This provides fast flow to the Reverse Osmosis faucet. When the tank is empty of water, the pressure at the air valve is 5 - 7 psi.

Postfilter: Water goes through the postfilter before going to the Reverse Osmosis faucet. See Fig. 24. The postfilter is an activated carbon type filter. Any remaining tastes and odors are reduced from the product water. Clean, high quality drinking water is available at the faucet.

Reverse Osmosis Faucet: The sink or countertop faucet has a hand operated knob to dispense drinking water. See Fig. 24. An air-gap is built into the faucet drain water connection to comply with plumbing codes.

Shutoff Assembly: The unit has an automatic shutoff system to conserve water. When the storage tank has filled to capacity, and the drinking water faucet is closed, pressure closes the shutoff to stop flow to the drain. After enough drinking water is used, pressure in the system drops, and the shutoff opens to allow the tank to be refilled. See Fig. 24.

Check Valve: A check valve is located in the Reverse Osmosis manifold above the center cartridge. The check valve prevents a backward flow of product water from the storage tank to drain. A backward flow could damage the Reverse Osmosis Membrane. See Fig. 24.

Flow Control: Water flow to the drain is restricted by the flow control. It maintains the desired flow rate to obtain the highest quality drinking water. The flow control is located inside the fitting on the Reverse Osmosis manifold drain port. See Fig. 24.

Reverse Osmosis Water Flow Schematic

FIG. 24

Water Flow Description

1. Water enters prefilter. Sand, silt and other sediments are reduced. Chlorine is also reduced. See Fig. 24.
2. Water leaves prefilter and proceeds to the Reverse Osmosis Cartridge.
3. Water enters the Reverse Osmosis membrane. Dissolved solids are reduced.
4. Processed water leaves the Reverse Osmosis Membrane and flows to the storage tank.
5. Drain water with dissolved solids leaves the Reverse Osmosis membrane and flows to the drain.
6. Faucet is activated.
7. Processed water leaves the storage tank and flows to the postfilter, where it is filtered to ensure fresh taste.
8. Water flows to the Reverse Osmosis faucet.

Maintenance

PREFILTER / POSTFILTER MAINTENANCE

NOTE: *It is recommended to replace the prefilter and postfilter cartridges at least every 6 months of product water use. Replace more often if they begin to plug with sediment.*

The prefilter and postfilter are replaceable sediment cartridges with activated carbon in their composition. See Fig. 25. You must periodically replace the prefilter and postfilter cartridge. This will protect the RO membrane from being destroyed by chlorine. It will also prevent the filters from plugging with sediment.

You may notice a slower output of product water as the prefilter and postfilter build up with sediment. Replace the prefilter and postfilter cartridges when this occurs.

RO MEMBRANE CARTRIDGE MAINTENANCE

The Reverse Osmosis cartridge is a tightly wound special membrane. See Fig. 25. The membrane reduces the dissolved solids and organic matter. The life of the Reverse Osmosis membrane cartridge depends mostly on the pH and hardness of the supply water (see Specifications). Cartridge life is shorter with higher pH. For example, if supply water pH is from 6.8 to 7.7, the cartridge may last for well over one year. However, cartridge life may be as short as 6 months if the pH is as high as 8.5 to 10. Higher pH weakens the cartridge membrane and causes pin-hole leaks. It's time to replace the Reverse Osmosis membrane cartridge when the production rate and/or quality of product water drops. Product water may begin to taste different, indicating solids and organics are passing through the Reverse Osmosis membrane. See Reverse Osmosis membrane cartridge replacement.

REVERSE OSMOSIS MEMBRANE CARTRIDGE REPLACEMENT

Complete the following steps to replace the cartridges.

1. Remove (turn to the left) the prefilter cartridge from the manifold to stop flow to the Reverse Osmosis membrane cartridge.
2. Remove the Reverse Osmosis membrane cartridge.
3. Remove the postfilter cartridge.
4. Discard the cartridges in a proper manner.
5. Install new cartridges in reverse order (post filter, Reverse Osmosis membrane and then prefilter). Turn cartridges to the right to reattach to the filter heads. Do not overtighten.
6. Purge the Reverse Osmosis system. See page 16 for instructions.

Register for reminders to change filters at whirlpoolwatersolutions.com

FIG. 25

PREFILTER / POSTFILTER CARTRIDGE REPLACEMENT

Complete the following steps to replace the cartridges.

1. Remove the prefilter cartridge (turn to the left) from the filter head. Then remove the postfilter cartridge.
2. Discard the cartridges in a proper manner.
3. Install new cartridges in reverse order (postfilter first, then prefilter). Turn cartridges to the right to reattach to the filter heads. Do not overtighten.
4. Purge the Reverse Osmosis system. See page 16 for instructions.

Maintenance

CHANGE COLLET AND O-RING

1. Remove the collet and o-ring from the fitting with a small screwdriver. Do not scratch the internal walls of the collet port. See Figs. 26 & 27.
2. Clean collet port, lubricate with silicone-based lubricant, and insert the o-ring seal into the bottom of the port. See Figs. 26 & 27.
3. Push the collet inward until it locks in place. See Figs. 26 & 27.

Change Collet and O-Ring **FIG. 26**

Disconnect Tubing **FIG. 27**

NOTE: It is not recommended that the RO assembly be opened. If this becomes necessary, pay careful attention to the layout of the parts and the routing of the tubing. It will be necessary to assemble the unit exactly as shown for the system to fit together and function properly.

FIG. 28

Troubleshooting

Problem: Chlorine taste and/or odor in the RO product water.	
Cause: The level of chlorine in your water supply exceeds maximum limits, and has destroyed the Reverse Osmosis membrane.	Correction: If the water supply contains more than 2.0 ppm of chlorine, additional filtering of the water supply to the Reverse Osmosis is needed. Contact your local water supplier. Correct this condition before doing maintenance on the Reverse Osmosis system.
Cause: The prefilter is no longer removing chlorine from the water supply.	Correction: Replace the prefilter, postfilter and Reverse Osmosis membrane cartridges. See Page 19.
Problem: Other taste and/or odor.	
Cause: Postfilter expended.	Correction: Replace the postfilter cartridge. If taste and odor persist, replace the prefilter cartridge and Reverse Osmosis membrane cartridge. See Page 19.
Cause: Reverse Osmosis membrane cartridge expended.	
Cause: Contamination in product water storage tank.	Correction: Use sanitizing procedures. Replace prefilter and postfilter cartridges. See page 15.
Cause: System contamination.	Correction: Sanitize entire system. Call 1-866-986-3223 for instructions.
Problem: System makes product water too slowly.	
Cause: Water supply to the Reverse Osmosis system not within specifications.	Correction: Increase water pressure, precondition the water, etc., as needed to conform before doing maintenance on the Reverse Osmosis system.
Cause: Prefilter or Reverse Osmosis membrane cartridges plugged with sediment.	Correction: Replace the prefilter cartridge. If rate does not increase, replace the postfilter cartridge and Reverse Osmosis membrane cartridge. See Page 19.
Problem: System makes lower amount of product water than usual.	
Cause: Storage tank air-charge less than 5-7 psi.	Correction: Open Reverse Osmosis faucet and drain tank until flow slows to a drip. Keep faucet open and check tank pressure. If low, pressurize to 6 psi. Close faucet to refill the tank.
Problem: High total dissolved solids (TDS) in product water	
Cause: Water supply to the Reverse Osmosis system not within specifications.	Correction: Increase water pressure, precondition the water, etc., as needed to conform before doing maintenance on the Reverse Osmosis system.
	Correction: Send treated and untreated water samples to a water analysis lab for testing. It is important to test both the treated and untreated water to determine system performance. If the TDS is not within the system's performance guidelines, replace the prefilter, post filter and RO membrane cartridges.
Cause: Plugged drain flow control insert.	Correction: Replace drain flow control insert. See no. 12 on page 22.
Problem: Continual water flow to drain and low or no water production.	
Cause: Missing flow control insert in drain port.	Correction: Make sure flow control insert is in place. See no. 12 on page 22.
Problem: Water leaking from faucet airgap hole.	
Cause: Drain side of faucet airgap (3/8" black tubing) plugged, restricted or incorrectly connected to drain point.	Correction: Inspect and eliminate restriction or plug. Check that drain line is routed properly. Refer to installation instructions for proper drain connection. See pages 5 & 9.
Problem: Water leaks at push connect fittings	
Cause: Tubing not cut square.	Correction: Cut tubing square. See pages 13 & 14.
Cause: Tubing not pushed in all the way.	Correction: Push tubing in all the way. See pages 13 & 14.
Cause: Tubing nicked.	Correction: Remove tube from connection. Remove nicked portion by cutting tube to shorter length. Reinsert in connection. See pages 13 & 14. If removing the drain line, leave in place the fitting that it connects to. See no. 12 on page 22.
Cause: Outer tubing surface finish not smooth.	Correction: Remove tube from connection. Remove problem area by cutting tube to shorter length. Reinsert in connection. See pages 13 & 14. If removing the drain line, leave in place the fitting that it connects to. See no. 12 on page 22.

This exploded view diagram illustrates the assembly of a water heater. The components are numbered as follows:

- 1:** Screws for the top cover.
- 2:** Washers for the top cover.
- 3:** Top cover assembly.
- 4:** Nut for the vent pipe.
- 5:** Washers for the vent pipe.
- 6:** Vent pipe flanges.
- 7:** Vent pipe connector.
- 8:** Vent pipe cap.
- 9:** Water heater tank.
- 10:** Vent pipe elbow.
- 11:** Vent pipe elbow.
- 12:** 1/4" red tubing.
- 13:** Vent pipe sections.
- 14:** Vent pipe sections.
- 15:** Vent pipe elbow.
- 16:** Vent pipe bracket.
- 17:** Water heater tank.
- 18:** Water heater tank.
- 19:** Water heater tank.
- 20:** Water heater tank.
- 21:** Water heater tank.

Parts List

Key No.	Part No.	Description
–	7333145	Automatic Shutoff Kit (incl. Key No. 3, 4 of Key No. 2 & 6 of Key No. 1)
1	↑	Screw (6 req.)
2	↑	Washer (4 req.)
3	↑	Automatic Shutoff Cover Assembly
–	7333137	Check Valve Kit (includes Key No. 4 & 2 of Key No. 5)
4	↑	Check Assembly
5	↑	O-ring, Auto. Shutoff Cover (2 req.)
–	7333179	Diaphragm Kit (includes Key Nos. 7, 8 & 2 of Key No. 6)
6	↑	Diaphragm (2 req.)
7	↑	Plunger
8	↑	Spacer Ring
9	7285368	Repl. Manifold Assembly (includes Key Nos. 1-8)
10	7287344	Elbow, Plug-in, 3/8 Stem x 3/8 Tube
11	7253785	Elbow, Plug-in, 1/4 Stem x 1/4 Tube
12	7275185	Flow Control Insert

Key No.	Part No.	Description
13	WHEERF	Pre & Post Filter Cartridge ★ (contains one of each)
14	WHEERM	RO Membrane Cartridge ★
15	119-8600084	Water Supply Fitting, 1/4" Q.C.
16	119-8600123	Drain Adaptor
17	7256018	Storage Tank
18	7251034	Connector, 1/4 NPT x 3/8 Q.C. Tube
19	WHEFSAT	Faucet, Brushed Nickel
	WHEFCHR	Faucet, Chrome ●
–	1128-11-AC	Cover Kit (includes Key No. 20 & 4 ea. of Key No. 21)
20	↑	Cover Set (includes both halves)
21	↑	Screw, Cover (4 req.)
■	7301203	Sanitization Kit ●
■	7315189	Auxiliary Storage Tank ●
■	7161823	Tubing, 1/4" x 20 ft. - white ▲ ●
■	7157280	Tubing, 3/8" x 20 ft. - white ▲ ●
■	7279749	Dropper
■	1128-11-AB	Owner's Manual

★ Please purchase replacement cartridges from the retailer where you bought your reverse osmosis system.

■ Not illustrated.

● Not included.

▲ Tubing lengths for remote installations, direct replacement for colored lengths of tubing.

Manufactured and warranted by
Ecodyne Water Systems
1890 Woodlane Drive
Woodbury, MN 55125

EXTEND YOUR WARRANTY:

Register your Whirlpool® replacement filter and R.O. membrane purchases

You can turn your R.O. system's two year factory warranty into a lifetime warranty by registering your purchases of Whirlpool® replacement R.O. membrane and filter cartridges. See "Lifetime Warranty" below for details.

WARRANTY

REVERSE OSMOSIS WATER FILTRATION SYSTEM - MODEL WHAPSRO (not including filter cartridges and R.O. membrane)

Warrantor: Ecodyne Water Systems, 1890 Woodlane Drive, Woodbury, MN 55125

Two Year Warranty:

Warrantor guarantees, to the original owner that, when installed by a Lowes Professional Series installer,* and maintained in accordance with the instructions, the Reverse Osmosis Water Filtration System (WHAPSRO) will be free from defects in materials and workmanship for a period of two (2) years from the date of purchase.

Lifetime Warranty:

Warrantor guarantees, to the original owner that the Reverse Osmosis Water Filtration System (WHAPSRO) will be free from defects in materials and workmanship for the lifetime of the owner, provided that:

- The system is installed by a Lowes Professional Series installer,* and maintained in accordance with the instructions in the same home where it was originally installed.
- The owner replaces both the pre and post filters every six (6) months and registers their purchase of the Whirlpool WHEERF filter cartridge set on www.whirlpoolwatersolutions.com. Purchase of no more than two (2) WHEERF filter sets in a 12 month period may be applied toward compliance with this warranty.
- The owner replaces the R.O. membrane every two (2) years and registers their purchase of the Whirlpool WHEERM membrane on www.whirlpoolwatersolutions.com. Purchase of no more than one (1) WHEERM membrane cartridge in a 24 month period may be applied toward compliance with this warranty.

Failure to adhere to the above requirements from the date of purchase voids the lifetime warranty.

If, during such respective periods, a part proves, after inspection, to be defective, Warrantor will, at its sole option, either replace or repair the part without charge except normal shipping and installation charges. Labor to maintain the equipment is not part of the warranty. Filters and membranes are not covered by the warranty.

TO OBTAIN WARRANTY PARTS, SIMPLY CALL 1-866-986-3223 for assistance. This warranty applies only while this product is in use in the United States or Canada.

General Provisions

The above warranties are effective provided the Reverse Osmosis Water Filtration System is operated in accordance with this owner's manual, including at water pressures not exceeding 100 psi, and at water temperatures not exceeding 100°F; provided further that the Reverse Osmosis Water Filtration System is not subject to abuse, misuse, alteration, neglect, freezing, accident or negligence; and provided further that the Reverse Osmosis Water Filtration System is not damaged as the result of any unusual force of nature such as, but not limited to, flood, hurricane, tornado or earthquake.

Warrantor is excused if failure to perform its warranty obligations is the result of strikes, government regulation, materials shortages, or other circumstances beyond its control.

***THERE ARE NO WARRANTIES ON THE REVERSE OSMOSIS WATER FILTRATION SYSTEM BEYOND THOSE SPECIFICALLY DESCRIBED ABOVE. ALL IMPLIED WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR OF FITNESS FOR A PARTICULAR PURPOSE, ARE DISCLAIMED TO THE EXTENT THEY MIGHT EXTEND BEYOND THE ABOVE PERIODS. THE SOLE OBLIGATION OF WARRANTOR UNDER THESE WARRANTIES IS TO REPLACE OR REPAIR THE COMPONENT OR PART WHICH PROVES TO BE DEFECTIVE WITHIN THE SPECIFIED TIME PERIOD, AND WARRANTOR IS NOT LIABLE FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES. NO WARRANTOR DEALER, AGENT, REPRESENTATIVE, OR OTHER PERSON IS AUTHORIZED TO EXTEND OR EXPAND THE WARRANTIES EXPRESSLY DESCRIBED ABOVE.**

Some states do not allow limitations on how long an implied warranty lasts or exclusions or limitations of incidental or consequential damage, so the limitations and exclusions in this warranty may not apply to you. This warranty gives you specific legal rights, and you may have other rights which vary from state to state. This warranty applies to consumer-owned installations only.

* Warranty period will be one (1) year from the date of purchase if installation is not purchased from Lowe's. Proof of purchase of the drinking water system and installation are required to validate warranty.

Performance Data

Reverse Osmosis Filter System - Model WHAPSRO

IMPORTANT NOTICE: Read this performance data and compare the capabilities of this unit with your actual water treatment needs. It is recommended that, before purchasing a water treatment unit, you have your water supply tested to determine your actual water treatment needs. This filter system is designed to be used for the reduction of the substances listed below. Do not use where water is microbiologically unsafe or of unknown quality, without adequate disinfection before or after the system. Systems certified for cyst reduction may be used on disinfected water that may contain filterable cysts. This system has been tested for the treatment of water containing pentavalent arsenic (also known as As (V), As (+5), or arsenate) at concentrations of 0.30 mg/L or less. This system reduces pentavalent arsenic, but may not reduce other forms of arsenic. This system shall be used on water supplies containing a detectable free chlorine residual at the system inlet or on water supplies that have been demonstrated to contain only pentavalent arsenic. Treatment with chloramine (combined chlorine) is not sufficient to ensure complete conversion of trivalent arsenic to pentavalent arsenic. Please see the Arsenic Facts section on page 26 for further information. While testing was performed under standard laboratory conditions, actual performance of this system may vary based on local water conditions. Some or all of the contaminants reduced by this unit may not be in your water supply. See elsewhere in this owner's manual for further instructions on filter replacement, system installation, operating procedures, and warranty. The maintenance instructions must be followed for the product to perform as indicated below.

General Information

This product is an undercounter system that filters and stores quality drinking water ready for use. It contains a carbon sediment filter, RO membrane, and an activated carbon post filter. This system has been tested according to NSF/ANSI 58 and 42 for reduction of substances listed below. The concentration of the indicated substances in water entering the systems were reduced to a concentration less than or equal to the permissible limit for water leaving the system, as specified in NSF/ANSI 58. The testing was performed using spiked chlorine free deionized water with ≤ 1 NTU turbidity, 7.5 ± 0.5 pH, $25 \pm 1^\circ\text{C}$, and $1\mu\text{S/cm}$ conductivity.

Maintenance

Replacement filter prices may vary. Estimated costs of replacement filter elements (part number WHEERF), or replacement membranes (part number WHEERM), range from \$39 to \$59.

Application Specifications for Feed Water

Pressure	40-100 psig (2.8-7.0 kg/cm ²)
Temperature.....	40-100°F (5-38°C)
Maximum TDS Level.....	2000 mg/L
Maximum Hardness @ 6.9 pH	10 gpg ¹ (171 mg/L)
Maximum Iron, Manganese, Hydrogen Sulfide.....	0 mg/L
Maximum Chlorine	2.0 mg/L ²
pH Range	4-10

¹ Grains per gallon.

² A carbon prefilter is part of this system to protect the reverse osmosis membrane from deterioration should there be chlorine in the supply water. This reverse osmosis system contains a replaceable treatment component critical for effective reduction of TDS. The product water shall be tested periodically to verify that the system is performing satisfactorily.

Daily Production Rate Model WHAPSRO: 14.76 gal./day (55.9 liters/day)²

Efficiency Rating Model WHAPSRO: 10.63%⁹

Recovery Rating Model WHAPSRO: 21.18%¹⁰

¹ Milligrams per liter, which is equivalent to parts per million (PPM).

² Tested by NSF International according to NSF/ANSI Standard 58.

³ NSF minimum percent reduction requirement. Acceptance level for this substance is based on percent reduction, rather than maximum effluent concentration.

⁴ Particles per milliliter.

⁵ Pico Curies per liter.

⁶ Nephelometric Turbidity Units.

⁷ Tested by Spectrum Labs, a qualified independent laboratory, against accepted industry protocol.

⁸ There is no maximum permissible effluent concentration for this substance because it is not included in the chemical reduction claims listed in NSF Standard 58. The maximum effluent concentrations listed were established by Spectrum Labs and are based on one third of the target influent.

⁹ Efficiency rating means the percentage of the influent water to the system that is available to the user as reverse osmosis treated water under operating conditions that approximate daily usage.

¹⁰ Recovery rating means the percentage of the influent water to the membrane portion of the system that is available to the user as reverse osmosis treated water when the system is operated without a storage tank or when the storage tank is by-passed.

Performance Data

ARSENIC FACTS

Background

Arsenic (abbreviated As) can occur naturally in well water. There are two forms of arsenic: pentavalent arsenic [also called As (V), As (+5), and arsenate] and trivalent arsenic [also called As (III), As (+3), and arsenite]. Although both forms are potentially harmful to human health, trivalent arsenic is considered more harmful than pentavalent arsenic. In well water, arsenic may be pentavalent, trivalent, or a combination of both. Additional information about arsenic in water can be found on the Internet at the U.S. Environmental Protection Agency (USEPA) website: www.epa.gov/safewater/arsenic.html.

Testing Your Water

Arsenic in water has no color, taste or odor. It must be measured by a lab test. Public water utilities must have their water tested for arsenic. You can get the results from your water utility. If you have your own well, you can have the water tested. The local health department or the state environmental health agency can provide a list of certified labs. The cost is typically \$15 to \$30.

Pentavalent vs. Trivalent Arsenic Removal

These systems are very effective at reducing pentavalent arsenic from drinking water. These models were tested in a lab and proven to reduce 300 parts per billion (ppb) pentavalent arsenic to below 10 ppb, the USEPA standard for safe drinking water.

RO systems are not as effective at reducing trivalent arsenic from water. These models will not convert trivalent arsenic to pentavalent arsenic. If you have free chlorine residual in contact with your water supply for at least one minute any trivalent arsenic will be converted to pentavalent arsenic and reduced by this RO. Other water treatment chemicals such as ozone, and potassium permanganate will also change trivalent arsenic to pentavalent arsenic. A combined chlorine residual (also called chloramine) may not convert all the trivalent arsenic. If you get your water from a public water utility, contact the utility to find out if free chlorine or combined chlorine is used in the water system.

Maintenance

It is strongly recommended that you follow the maintenance instructions and have your water tested periodically to make sure the system is performing properly. See replacement element information above for recommendations on maintaining your Reverse Osmosis drinking water treatment system.
